[For the answers, click here.](#)

A 41-year-old woman presents with chest pain and dysphagia. Routine laboratory studies reveal profound neutropenia. The patient has a history of hepatitis B, hepatitis C, schizophrenia, and recent keratoplasty. Hemoglobin level is 12.3 g/dL; platelet count is normal. She smokes tobacco (4 or 5 cigarettes a day) and crack cocaine (2 or 3 times a week).

[For the answers, click here.](#)

Skin lesions are noted on the arms and legs of a 54-year-old woman with type 2 diabetes mellitus and hypertension. The lesions are itchy and are aggravated by the patient's "rubbing" them. Multiple lesions are identified all over her body in no specific pattern; however, they are bilateral and symmetric and in different stage of healing.
